

Nova Energy Corp.

Sample Financial Report - FY 2026

1. Executive Summary

Nova Energy Corp. is a fictional integrated energy company. In FY 2026 revenue fell 6% to \$8.4 billion as refining margins compressed and one offshore field suffered a production delay. Management maintained its dividend but warned that payout growth is unlikely next year.

2. Outlook

Management expects modest volume growth from a newly signed multi-year LNG supply contract, but cautioned that commodity price volatility and higher maintenance spending will pressure operating margins over the next one to four quarters.

3. Key Risks

Commodity price exposure: a 10% drop in crude prices would reduce operating profit by an estimated \$0.6 billion. Regulation: stricter emissions rules may raise compliance costs. Operational: aging refinery assets increase outage risk. Debt: net debt to EBITDA rose to 2.4x.

4. Liquidity

Nova Energy holds \$2.1 billion in cash and has no major debt maturities before 2028. Capital expenditure guidance was reduced by 8% to preserve liquidity.
